

Data Sheet

Outpost Antivirus Pro

High-speed antivirus that keeps you ahead of the game

Keep malware off your PC

With the rapid increase in threats, versatility and comprehensive protection are key for today's anti-malware solutions. Multi-layered security delivers the strongest challenge to the complex security risks that range from network intrusions and malware infections to loss or compromise of personal data and identify theft.

There are three security measures no-one should be without in today's world: a firewall to guard your Internet connection, anti-virus to protect you from malicious programs, and proactive security capabilities to pre-empt possible attacks from unknown sources.

Outpost Antivirus Pro includes the last two of them. It protects your digital assets against malicious programs that can not only corrupt data, but steal it or use your credentials to harm other innocent users. Outpost Antivirus Pro also offers proactive defenses that do not allow virus-like activity take place by blocking suspicious or unauthorized behavior. As a complementary measure, OAV also ensures that websites you visit cannot silently serve up malware as you surf the Net.

OAV does its job, quietly and efficiently

There are any number of ways malware can get onto your PC. The job of the security solution is to keep that malware off your machine, and to do it as efficiently as possible.

Outpost Antivirus Pro is there to protect your system against malicious downloads and predatory websites. It keeps information you specify as being confidential in a safe storage area and prevents this information from being accidentally or deliberately sent over the web. The vulnerable locations of your system are closely monitored in real time against the arrival or activation of any form of viral programs or spyware. The incremental scans you undertake after you've been online can be completed in a fraction of the time a full scan would take, thanks to SmartScan accelerated scan technology.

With Outpost, you get fast, efficient, antivirus for one low annual fee.

Key technologies

- Combined anti-virus and anti-spyware
- Host protection
- Known rootkits protection
- Web & transaction security
- Self-protection

Key benefits

Save time with faster scans

Thanks to SmartScan technology, repeat malware scans happen at lightning speed.

Easily and effectively remove all types of malware

Now you can benefit from two independent, complementary anti-malware labs working together to provide the most comprehensive and up-to-date threat coverage. Virus, trojan and other infective malware research comes from the VB100-certified Virus Buster team, and Agnitum's research team provides the spyware, worm, adware and other snoop-ware intelligence.

Proactive protection against zero-day viruses and other unknown threats

The advanced Host Protection module protects you against new and unknown malware. By preemptively blocking the kind of inappropriate program activity that might indicate an attack, Outpost stops the threat before it can cause damage without the need to wait for signature updates.

Personal information can't be stolen

Trojans and viruses attack by extracting data from a PC. With Outpost's ID Block, your credit card information, account passwords, and other critical data are put into a special "lockdown mode", preventing unintentional or deliberate disclosure. You can define a list of sites that you trust to access some or all of this information.

Surf with confidence

The constantly-updated URL blacklist automatically protects you as you explore the Web. It steers you away from suspicious websites that may be infected with drive-by downloads and locations hosting exploits or other malicious or offensive content, and prevents access to known phishing sites.

Always-on virus protection

Outpost Anti-Virus cannot be deactivated by targeted attacks, a common route viruses take to disable active security protection.

Key features

Proactive security

Preemptive threat protection

Outpost Antivirus Pro provides the first line of defense against malicious software by proactively controlling how programs behave and interact on a PC and preventing security breaches. The Host Protection module proactively monitors for and blocks sophisticated hacking techniques used to compromise or steal data. By analyzing threats and displaying actionable alerts, Host Protection blocks zero-day attacks and other unauthorized activities, providing advanced protection against botnets, rootkits and inadvertent data disclosure.

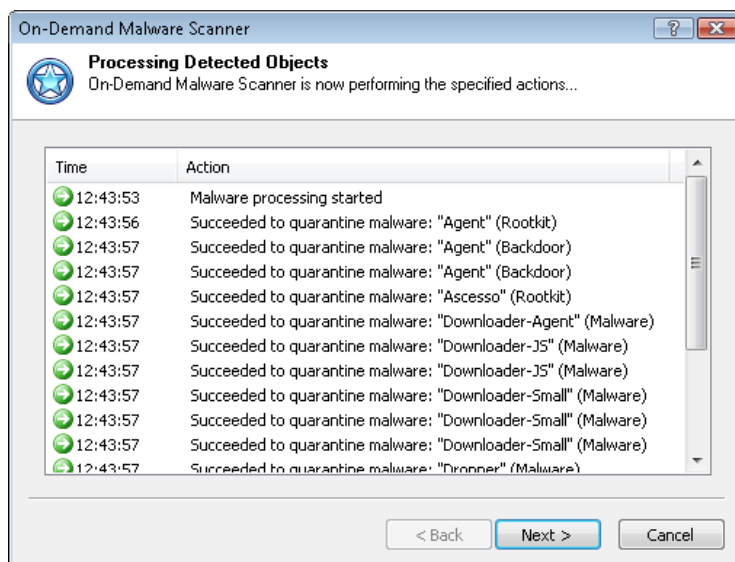

This latest version extends the range of monitored events and operations for even greater and more customizable protection.

Self-protection

Today's malware frequently seeks to shut down security software to make its infection process easier. By incorporating solid tamper-proof protection for all its components, Outpost Antivirus Pro makes it impossible for anyone except the authorized user of the program to disable or close active protection.

Efficient anti-malware

Defense against all types of viruses and malware

Both anti-virus and anti-spyware capabilities ensure that your computer is kept clean of any malicious program that might infect it while you're surfing the web. The on-access monitor constantly watches for and instantly disinfects, quarantines or removes any malware objects found in key areas of the PC, while the on-demand scanner lets you scan for and remove threats on hard disks, network folders, DVDs, or external storage devices. Email attachments are checked in real time as they leave or arrive, and you can move any suspicious file to the quarantine area for later review.

Additional protection prevents known rootkits and other sophisticated malware from loading and embedding themselves on your PC.

Scheduled scans and exclusions

You can set up a flexible schedule for regular malware scans, plus you can define custom scanning criteria such as checking critical system areas whenever malware definitions have been updated.

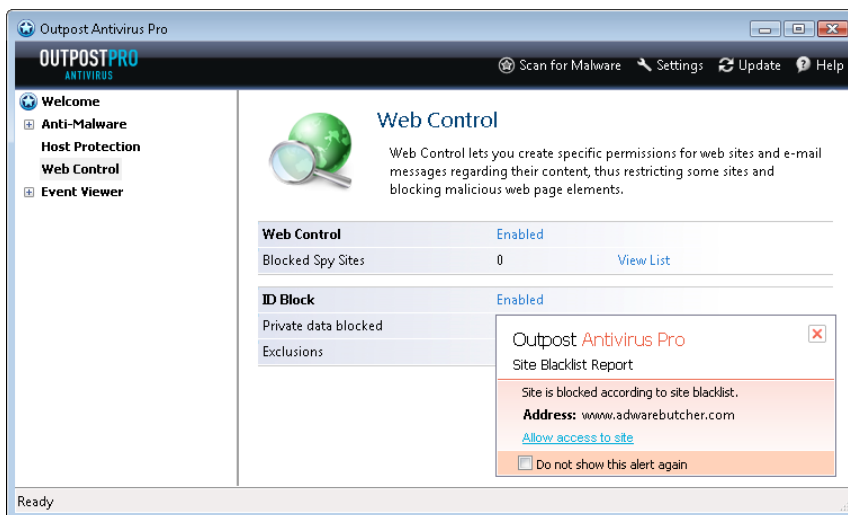

Faster, more thorough scans

As a result of incorporation of a new engine from our technology partner, scans now take fewer resources and complete much faster. Heuristics analysis introduces detection of mutated threats.

Privacy & web safety

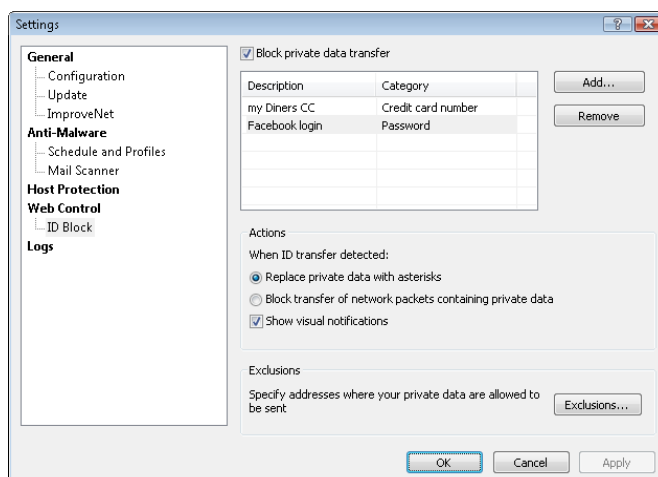

Unsafe web site access restriction

Outpost can optionally alert and block access to potentially malicious or unwanted web sites based on a predefined list of URLs. This filtering ensures you won't become a victim of inadvertent drive-by malware infection or phishing attacks that are looking to steal your passwords, login information and other sensitive data. The list of blocked sites is updated via the automatic updates and can be edited to reflect your preferences.

Safe repository for personal data

Any confidential information – for example, bank account numbers and passwords – that you define using ID Block is blocked from leaving the confines of your PC through communication channels such as IM, web or email. ID Block protects you against identity theft and phishing attacks that target personal, confidential information. Plus, it ensures that no-one else – including other members of your household - can accidentally or deliberately disclose this information on the web.

Compatibility

Support for 64-bit Windows

Outpost Antivirus Pro has been specifically designed to work with 64-bit Windows architecture, so that you can experience the benefits of 64-bit computing without worrying about your security.

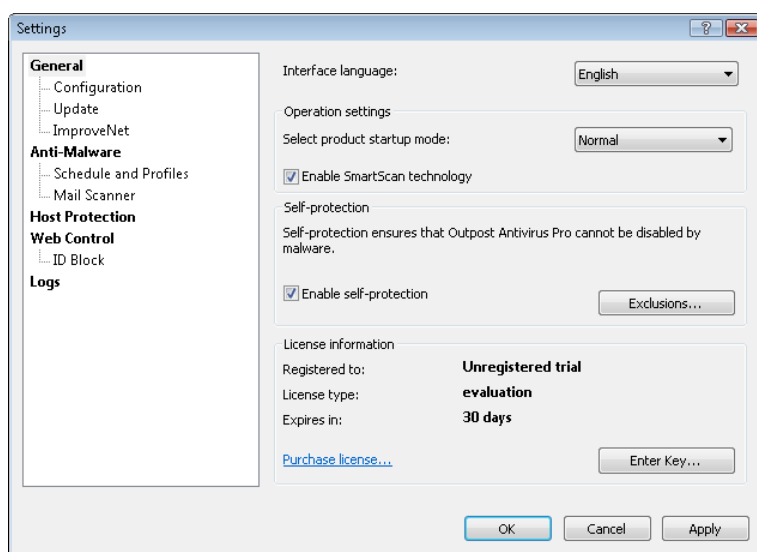

Convenience and ease of use

Hands-free updates

Whenever an update to Outpost Antivirus Pro is released during your license period, the update module automatically retrieves the latest version from the Agnitum server and applies it as soon as you authorize it to do so.

Performance & optimization

Faster, more intelligent scans

SmartScan, the intelligent file sensing monitor, scans only the modified portions of the file system, avoiding repeat scans of files that have not changed since the last scan. The fast and intelligent anti-malware engine has no impact on overall system performance and can operate in the background while you work.

Specifications:

Supported platforms: 32- and 64-bit Windows (Vista, XP, Server 2008, Server 2003), Windows 2000.

Min. hardware requirements: 450 MHz CPU(x-86/x-64/multi-core), 256 Mb RAM, 100 Mb free disk space.
